

BBC 6 Minute English Listening Practice

How Climate Change Affects Animal Migration

Name: _____

Class: _____

Score: _____ / 20

No.	Sentence
1	Animal migration usually happens because of changes in _____.
2	Wildebeest move through two East African areas depending on the _____.
3	Some animals migrate to find _____.
4	Migration can also be connected with reproduction, including mating and _____.
5	Some shark species are able to travel _____.
6	One example describes great white sharks travelling from Australia to _____.
7	Climate change affects migration by changing ocean _____.
8	Sea turtles eat _____, which can absorb carbon.
9	Managing about ten animal groups could remove around _____ of carbon each year.
10	Some experts estimate that yearly climate goals require removing _____ of CO2.

11 **How is animal migration introduced in the programme?**

- A As movement from one place to another, often linked to weather or temperature
- B As a rare behaviour found only in ocean animals
- C As a permanent move caused mainly by human activity
- D As a journey made only when animals are in danger

12 **Which set of reasons for migration does Trisha give?**

- A Avoiding predators, finding shelter and escaping storms
- B Following human boats, cooling down and resting
- C Finding food, mating and giving birth
- D Learning routes, competing and changing colour

Answers written in the margins will not be marked.

Answers written in the margins will not be marked.

- 13 **What example is used to show that some sharks travel very far?**
- A They cross from Kenya to Tanzania each year
 - B Great white sharks have moved from near Perth to South Africa
 - C They swim only around the Maasai Mara
 - D They follow sea turtles along the ocean floor
- 14 **What effect is climate change having on sharks?**
- A It is stopping sharks from eating sea turtles
 - B It is making all sharks stay near Australia
 - C It is increasing the number of sharks immediately
 - D It is altering their migration patterns through ocean-temperature change
- 15 **Why does the programme mention sea turtles and seagrass?**
- A To explain how sharks can indirectly help carbon absorption
 - B To show that sharks mainly eat seagrass
 - C To argue that sea turtles are the main cause of climate change
 - D To prove that ocean plants cannot store carbon
- 16 **What follows when sharks are present in an area, according to Neil's summary?**
- A Sea turtles protect more seagrass
 - B Less carbon can be absorbed by the seabed
 - C More seagrass remains, so more carbon is absorbed
 - D Climate change immediately stops
- 17 **What is Sophie's point about migratory animals?**
- A Only sharks matter for climate action
 - B Some migrating species can be an under-recognised climate tool
 - C Migratory animals are too difficult to protect
 - D Climate change has ended most migration
- 18 **What does Trisha's research suggest about managing about ten animal groups?**
- A It would remove all CO₂ from the atmosphere
 - B It would mainly protect tourism
 - C It would produce six gigatonnes of CO₂ each year
 - D It could sequester about six gigatonnes of carbon yearly

19 **Why does Sophie add the 10-gigatonne figure?**

- A To give scale to the six-gigatonne estimate
- B To reject Trisha's research completely
- C To explain shark migration routes
- D To show that animal protection is unnecessary

20 **What does the "60%" explanation imply about the six-gigatonne figure?**

- A It is a tiny amount that can be ignored
- B It is exactly equal to the total amount needed
- C It is a very large share of the estimated yearly removal need
- D It is unrelated to climate goals
